Goal

- Our project is a showcase of two unique isometric design styles, environments
- Our goal was to create an interactive website using [three.js](https://threejs.org/) Our main intention was to showcase both rooms at the same time switching from a dark medieval dungeon room to a bright sunny living room, as well as interacting with the room itself moving the room around to get a better look at it as well as some info about different objects like the barrels, crates, shelves, plant, etc. it's simple and the gets the job done

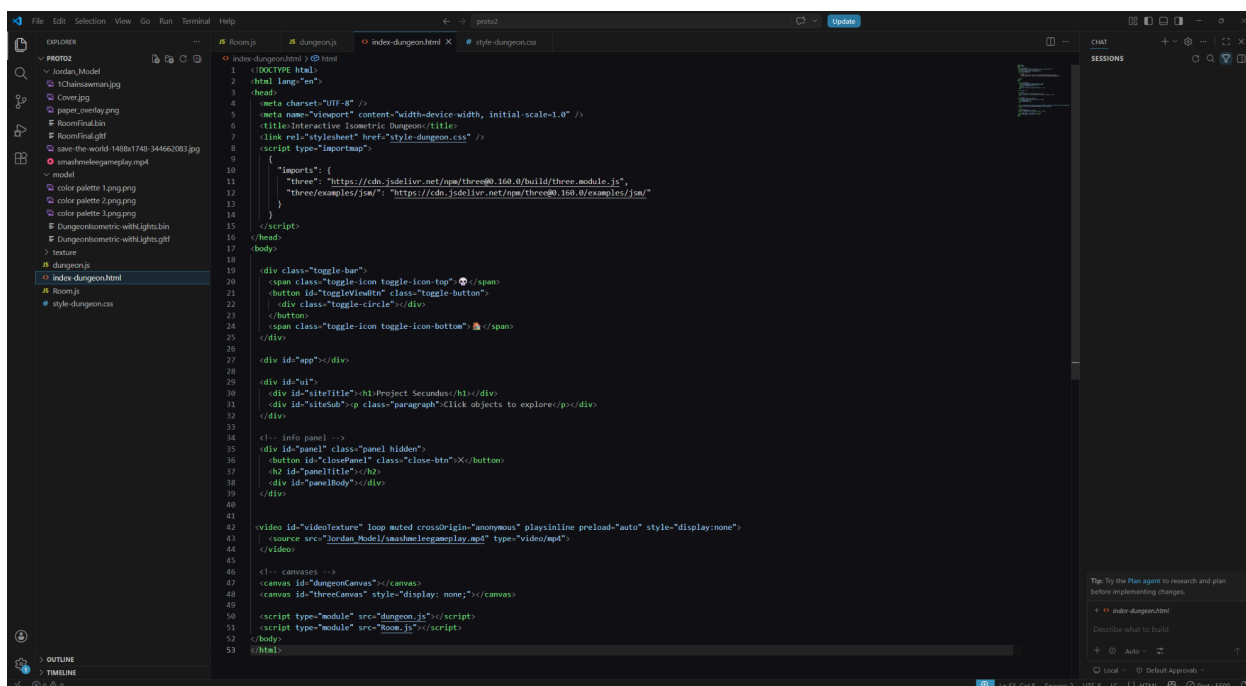

Intentions and implementations

- Our original intention was similar to the final product, but the living room was going to be the first room that the viewer is able to see, and once you interact with the TV, it would bring you into the dungeon as if you were inside a video game!
- The interactions would be the same moving around the room; however, this would have been a great addition
- Another implementation that we intended to add was to make the project look grainy; however, this backfired with the project being laggy, so we decided to remove that style and went with our original design of being simple and optimal.
- We wanted to add a zoom function with buttons; however, we changed it so that the user can zoom in and out with their scroll wheel

Some implementations we've put in the code:

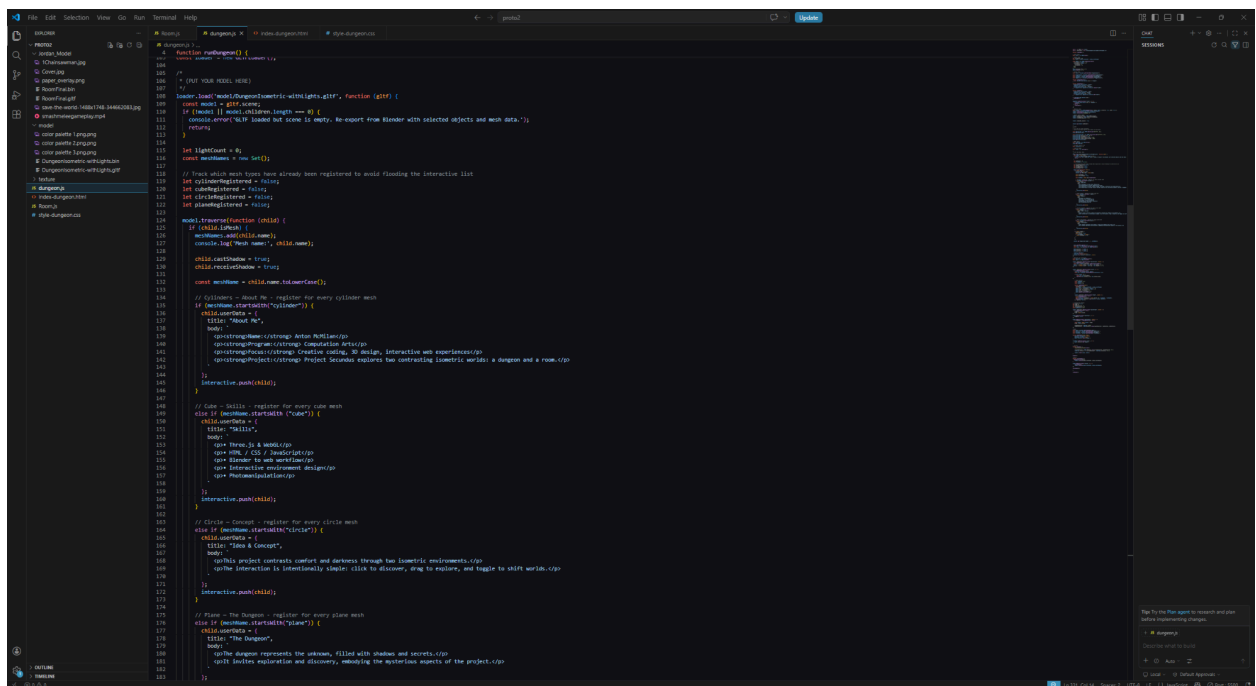

- A button that swaps between the two rooms
- The first section involves a nightly visit to the torch-lit dungeon. Once you press the button, it swaps the dungeon to a comforting living room with a GameCube, some controllers and everything that you would see in a living room
- An Interaction with limited drag on the x, y, and z axis.
- A zoom in, zoom out function.
- A feature that allows a video to play on the TV screen
- Lighting (dungeon torches)
- Intractable objects that reveal information about the creator and their creations

This photo showcases the HTML, which has the toggle switch that switches between the two canvases as well as the video to display on the TV. These were interesting to work with

```

The image shows a VS Code editor window with a file named 'index.js' open. The file contains a JavaScript function 'newbie' that generates a list of interactive cards for a 'Newbie' user. The cards are organized into sections: Frontend, Backend, Fullstack, DevOps, and various programming languages and frameworks. Each card has a title, a description, and a link to a resource. The editor interface includes a sidebar on the left with file explorer and search, a main editor area, and a right sidebar with a file tree and a search bar. The status bar at the bottom shows the file is saved and the editor is in a state of 'Ready'.

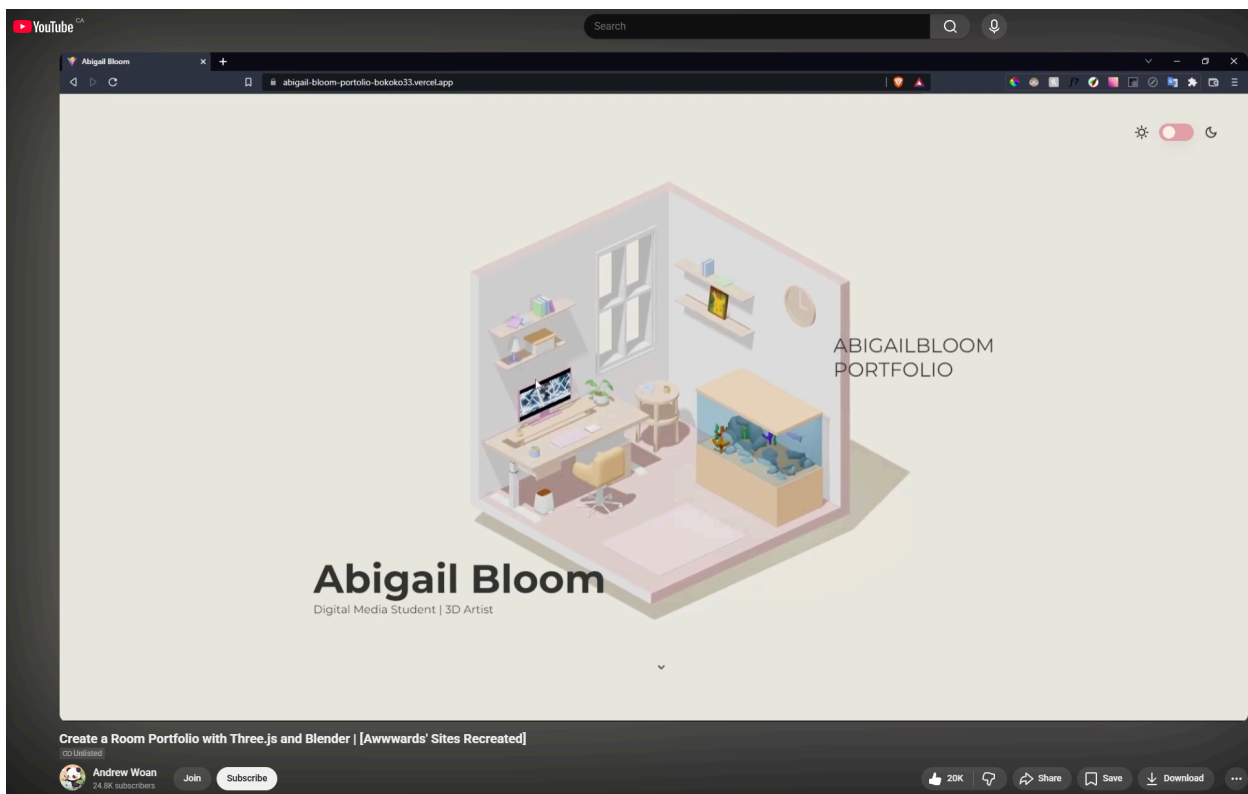

Libraries:

In our project, the only things we've used are [three.js](https://threejs.org/) and Visual Studio Code, for the coding section and Blender for our 3D models

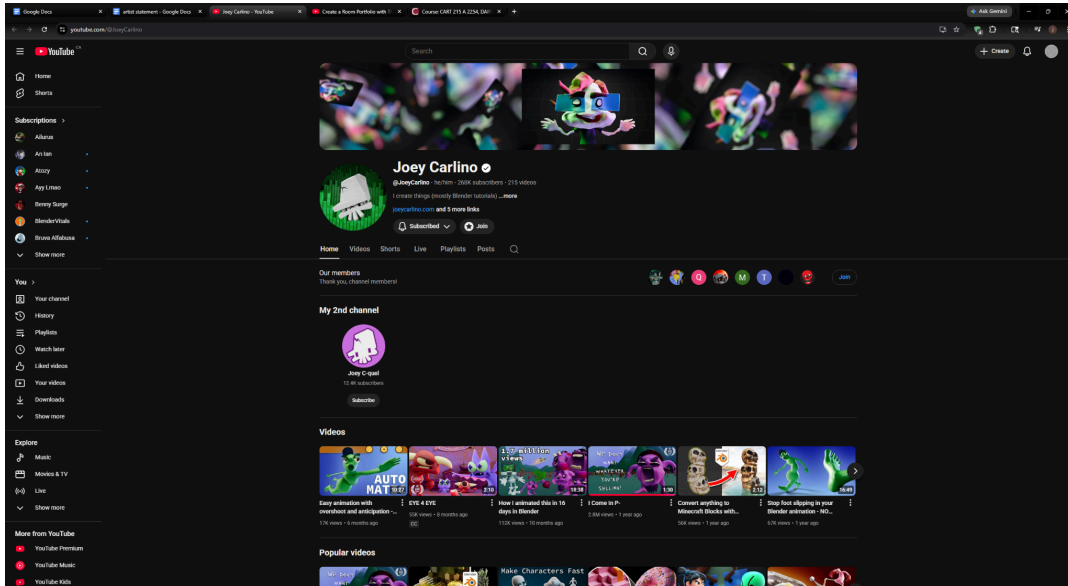

Inspiration

- As we were searching for inspiration on what to do for our project, we found some isometric rooms on [three.js](https://threejs.org/), which led us to revolve our project around isometric rooms; however, the main inspiration we got to create an isometric room on [three.js](https://threejs.org/) was from Andrew Woan's video
- **Create a Room Portfolio with Three.js and Blender | [Awwwards' Sites Recreated]**
<https://www.youtube.com/watch?v=rxTb9ys834w&list=LL&index=2&t=11455s>
- We did take some liberties on how he did it, and decided to go with our own methods on how we wanted the project to look

Side inspirations

- We both had different experiences and inspirations on how our rooms should be.
- Jordan went with a low-poly room whose style draws inspiration from Joey Carlino (<https://www.youtube.com/@JoeyCarlino>), a 3D artist specializing in low-poly renders. As someone who has just returned to Blender, his videos and style inspire me to become a better 3D modeller

- While Khuong has experience in Blender and does higher-quality renders, his inspiration comes from Max Hay (<https://www.youtube.com/@maxhayart>), a 3D artist who works on higher-quality renders and hosts tutorials for others to work on, and someone Khuong has been following and working with to improve his 3D modelling
